

Output2. ReactJS-HOL

Objectives

- **Understand React Components:** Learn how React applications are built by dividing the user interface into small, reusable, and independent components.
- **Differentiate Components and JavaScript Functions:** Understand how React components differ from regular JavaScript functions by returning JSX and managing the application's UI.
- **Explore the Types of Components:** Gain knowledge of the two main types of React components—functional components and class components—and understand when to use each.
- **Learn About Class Components:** Understand how class components are created, how they manage state, and how they use React lifecycle methods.
- **Learn About Functional Components:** Explore functional components, which provide a simpler and more modern approach to building React applications using JavaScript functions.
- **Understand the Component Constructor:** Learn the purpose of the constructor in class components, including how it initializes state and binds methods before the component is rendered.
- **Understand the render() Function:** Learn how the render() method in class components is responsible for returning the JSX that defines what is displayed on the user interface.
