

Output3. ReactJS-HOL

Objectives

- **Explain React Components:** Understand how React components help build user interfaces by dividing an application into small, reusable, and independent pieces, making development and maintenance easier.
- **Identify the Differences Between Components and JavaScript Functions:** Learn how React components differ from regular JavaScript functions by returning JSX to display user interfaces and supporting React-specific features such as props and state.

- **Identify the Types of Components:** Gain an understanding of the two main types of React components—Functional Components and Class Components—and learn their roles in building React applications.
- **Explain Class Components:** Understand how class components are created using ES6 classes, how they manage state, handle lifecycle methods, and build dynamic user interfaces.
- **Explain Functional Components:** Learn how functional components use JavaScript functions to create simple, reusable, and efficient UI elements, making them the preferred approach in modern React development.
- **Define Component Constructor:** Understand the purpose of the constructor in class components, which is used to initialize the component's state and bind event-handling methods before the component is rendered.
- **Define the render() Function:** Learn how the render() method is responsible for returning JSX that defines the content and layout displayed on the web page whenever the component is rendered or updated.
