

Output8Counterapp-ReactJS-HOL

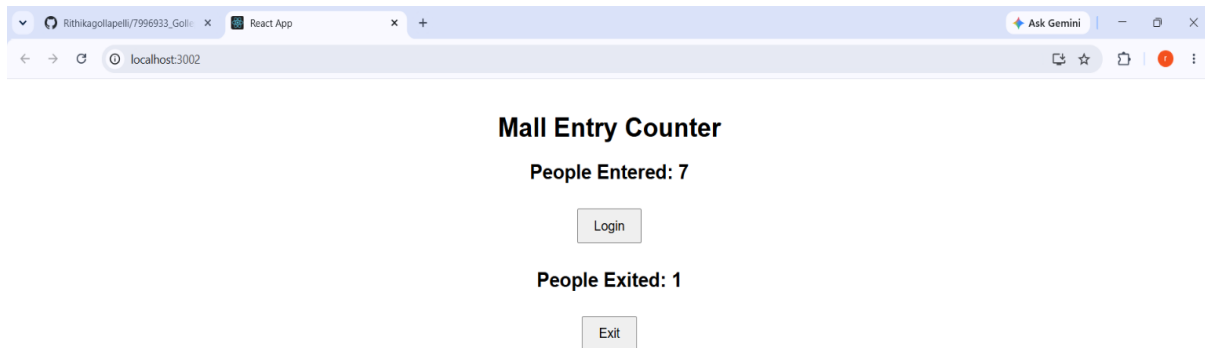

When I click login it can People Entered: 1

Click it again: People Entered: 2, 3... 7

When I click Exit People Exited: 1

Click it again: People Exited: 2

Objectives

Explain React State

React State is a built-in feature that allows a component to store and manage data that can change over time. Unlike props, which are passed from a parent component, state belongs to the component itself and can be updated whenever user interactions or application events occur. When the state changes, React automatically re-renders the component to display the updated information, making the user interface dynamic and responsive.

State is commonly used to handle:

- User input in forms.

- Button click events.
- Counter applications.
- Login status.
- Dynamic content updates.
- API response data.
