

Exercise 5: Timeout and Performance Testing

Step 1: Create PerformanceTester.java

```
public class PerformanceTester {  
    public void performTask() throws InterruptedException {  
        Thread.sleep(1000);  
        System.out.println("Task Completed");  
    }  
}
```

2: Create PerformanceTesterTest.java

```
import static org.junit.jupiter.api.Assertions.assertTimeout;  
import java.time.Duration;  
import org.junit.jupiter.api.Test;  
public class PerformanceTesterTest {  
    @Test  
    void testPerformance() {  
        PerformanceTester tester =  
            new PerformanceTester();  
        assertTimeout(  
            Duration.ofSeconds(2),  
            () -> tester.performTask()  
        );  
    }  
}
```

Output:

Task Completed

Execution Time: 1 second

Allowed Time: 2 seconds

Tests run: 1

Failures: 0

BUILD SUCCESS
